TITLE: Production of Adimin fiber

PERIODICAL: Khimicheskiye volokna, no. 5, 1962, 47 - 49

TEXT: Experiments made in 1955 - 57 to imitate the Western Trelon fiber had failed. The present paper gives results of experiments started in 1961 to produce a fiber, "Adimin", from hexamethylene diammonium adipate (AH salt) and ϵ -caprolactam in the ratio of 90 : 10. These experiments were made with an apparatus used for producing caprone fiber. The process consists in: dissolution of the two monomers; filtration of the solution; polyamide formation; extruding of the polyamide into bands and crumbling of the bands; drying of the polyamide and spinning; further processing of the fiber in the textile plant. Since Adimin contains only 1.5-2% low-molecular compounds there was no need to wash out the crumbled polyamide. The molecular weight of polyamide was found to drop with increasing content of stabilizer (adipic acid): the MW was 23,500-24,000 with 0.45% adipic acid, and 18,700-18,800 with 0.85% adipic acid. An MW Card 1/2

Production of Adimin fiber

S/103/62/000/005/002/002
B101/B186

of 18,800-20,000 is recommended for producing hosiery. Adimin is more heat-resistant than caprone, its MW remained unchanged when heated to 280°C for 1 hr. Spinning of Adimin was performed with PP-700-I (PP-700-I) spinning machines, rate of fiber formation 700 m/min, polyamide temperature 270-271°C, drawing 1 : 3.3. The fiber showed 35-37 km breaking length and 36-38% elongation. As compared with caprone, Adimin has higher shrinkage and lower stiffness: data for fixed, twisted fiber with 200 windings per meter: shrinkage in H₂O at 100°C, 5.1% (caprone 6.5%), stiffness measured with Pavlov's pendulum apparatus, 103 (caprone 143). The fiber is easily worked into hosiery. There are 3 tables.

TITLE: A study of enanthid fiber tensility increase

PERIODICAL: Khimicheskaya volokna, no. 2, 1963, 22 - 24

TEXT: The effect of the aminoenanthic acid quality on the properties of cord enanthid fiber, No. 145 was investigated. Two major possibilities of enanth tensility increase were studied: improvement of the initial monomer quality for the production of the enanthid resin, and an increase of the resin molecular weight. Experimental batches of aminoenanthic acid of first and improved qualities, produced on an experimental stand at the electrolysis plant, were used for the investigation. The fiber formation was accomplished on a spinning mill for experimental production at the Olin Combinat. It was shown that an elevation of the initial raw material properties leads to an increase of fiber tensility (by 6 - 7 rkm), and of all the physico-mechanical properties as well. The thermo-stability of the resin was studied at 290 and 340°C. It was shown that at 340°C and heating for 60 min, a destruction occurs of the enanthid resin having

Card 1/2

A study of ebanthio fiber tensility increase

8/183/63/000/002/003/003
A051/A126

A high molecular weight. An increase of the molecular weight of the ebanthio resin, under the existing design of the spinning bobbins necessitates a sharp increase of the formation temperature (up to 340 - 350°C) for resins with a specific viscosity of 0.92 - 1.10 or a change of the bobbin design, namely, by using a screw conveyor type. The relation between the formation temperature and viscosity of the initial ebanthio resin was also investigated and it was shown that the use of resin having a high specific viscosity is not recommended for fiber formation on the existing fiber-manufacturing machinery. It was shown that the addition of NN'-di-(3,4-phenylene)diamine thermostabilizer sharply increases the resin destruction resistance at 340°C. A change in the resin formation conditions, such as the use of masticators or new bobbins, would change the demands placed on the resin. There are 5 tables.

"Priroda" No 7

In autumn 1948, in harvesting potatoes from the gardens of the Polissk Sci Res Sta for Agr, rhizomorphs of the *Araillaria Mellea* were found on the tubers. It is interesting that they occurred not only in places near tree stumps, their natural habitat, but even 1.5 km away from woods. This shows that potato fields must be carefully cleaned even of brushwood, and not planted with mixed cultures.

ABSTRACT: An examination is made of the experience of certain establishments and of the results of industrial investigations of a series of processes. Rationalization and unification of the processes should, it is recommended, be conducted along the lines of, (a) converting all the Co into matte at Ni anodes and production of enriched Co concentrates at plants treating Cu-Ni ores; b) introduction of continuous counter-current processes at large establishments. It is recommended that a standard Co production enterprise be established based on the hypochlorite

TITLE: Stamping thin steel bottoms on a single-action hydraulic press

PERIODICAL: Kuznechno-shtampovochnoye proizvodstvo, no. 9, 1962, 41-42

TEXT: A die set and cold progressive stamping process are described by which 940 mm diam spherical vessel bottoms of 2 mm thick X18H9T (Kh18N9T) stainless sheet steel are obtained without any wrinkles or bulges and without heat treatment after stamping. The method is used at the Tikhoretskiy mashinostroitel'nyy zavod "Krasnyy molot" (Tikhoretsk "Krasnyy molot" Machine-Building Plant) on a 600-t single-action hydraulic press. Bottoms with a 720 mm main bend radius and a 208 mm bend radius at the short straight wall portion are stamped from 1280 mm diam blanks. The die set is illustrated and the stamping process described in detail. Recommendations are included concerning the diameter of blanks with a surplus necessary for clamping-in the die set, the radii on the punch and die, work clearances and lubricant. The method is recommended for use in stamping thin bottoms from ferrous and nonferrous metals. There are 3 figures.

Kiriyenko, Yevgeniy Grigor'yevich, Vladimir Iosifovich Lutsyk, and Georgiy Avgustinovich Piskorskii

Kholodnaya shtampovka (Cold Stamping) Moscow, Mashgiz, 1959. 167 p.
Errata slip inserted. 20,000 copies printed.

Reviewer: M.Ya. Levitskiy, Candidate of Technical Sciences, Ed.: A.V. Sivay,
Docent; Chief Ed. (Southern Division, Mashgiz); V.K. Serdyuk, Engineer.

PURPOSE: This textbook is intended for individual and group training of press operators for cold-stamping operations. It may also be useful to skilled press operators.

COVERAGE: The book deals with the following topics: basic problems of production organization in cold-stamping shops; fits and tolerances, inspection and measuring instruments; cold-stamping processes and equipment; and the mechanization and automation of cold-stamping operations. Also discussed are reading of drawings, problems of labor organization, time-standard setting, wages, and safety engineering. No personalities are mentioned. There are 20 references, all Soviet.

TITLE: Choice of machines (presses) for the manufacture of molded products from heated coal mass

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 20, 1961, 399, abstract 20M39 (Tr. in-ta goryuchikh iskopayemykh AN SSSR, v. 12, 1961, 82-93)

TEXT: Several schemes of machines for molding coal in plastic state are considered: a "two-stage nozzle roller press", a three-stage roller press with cutting rolls, a unit consisting of a reciprocating ramming machine, a roller conveyor, and a roll system comprising also molding rolls; a coal molding machine including a screw press with nozzle and rollers for rolling plastic bands and molding products from them; a multiscrew band press with molding rolls. The basic difference between briquetting and plastic molding of coals is pointed out. [Abstracter's note: Complete translation.]

TITLE: Alkaloids of a form of thalictrum minus L. commonly found in Bulgaria

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 18, no. 9, 1965, 849-851

TOPIC TAGS: plant chemistry, alkaloid, IR spectrum, chromatography

ABSTRACT: This article describes the first alkaloid-content investigation of the Thalictrum minus L. plant commonly found in Bulgaria. Its leaves resemble those of Thalictrum simplex. The article describes in details the experimental procedures, in particular the isolation of O-Methylthalmethin ($O_3H_{26}O_6N_2$), Thalmethin ($O_3H_{36}O_6N_2 \cdot H_2O$), and Berberin. Characteristic features of the various infrared spectra are also given. Alkaloids were proven by thin-layer chromatographic procedures. [Orig. art. in German] [JPRS: 34,903]

Title : The Use of Tetracycline in Children of Early Age
Suffering from the Lobar Pneumonia.

Orig Pub: Pediatriya, 1957, No 9, 73-77.

Abstract: Tetracycline (I) was used in the treatment of acute lobar pneumonia in 100 children aged 1 year or less. I was administered internally in doses of 30-50 mg/kg/24 hours, in 4 divided doses. The course of therapy lasted 7-12 days, 8 days on the average. Treatment with I, along with the usual complex therapy, resulted in rapid normalization of the temperature, disappearance of toxicosis,

"Revropatol i Psikhat" Vol XX, No 2, pp 12-16

Meningoencephalitis of varying degs of severity (up to most serious forms) occurs when parotitis virus affects the brain. The brain is affected only when swelling of glands is light or absent. Onset of the disease is violent, but there is

186T78

USSR/Medicine - Virus Diseases
(Contd)

Mar/Apr 51

rapid improvement and invariably complete recovery without aftereffects. Serous meningitis caused by parotitis virus is distinguished from tuberculous meningitis by the violent onset accompanied by vomiting, low or normal pressure of cerebrospinal liquid, and sugar content in cerebrospinal liquid exceeding 45 mg.
